In this section, we're going to explain how to balance a chemical equation by using a real life example, the chemical equation that occurs when iron rusts:

How to Balance Chemical Equations: 3 Simple Steps

If you want to write a chemical equation, start by writing the chemical formulas of each reactant. Use the prefixes, such as mono-, di-, tri-, and tetra-, to figure out the number of atoms present for each element, and write this number as a subscript for each element. For example, dihydrogen monoxide would be more easily written as H₂O.
