11. Aspect Oriented Programming with Spring

Aspect oriented programming (AOP) as the name suggests uses aspects in programming. It can be defined as the breaking of code into

Aspect Oriented

different modules, also known as modularisation, where the aspect is the key unit of modularity.

Aspects enable the implementation of crosscutting concerns such as- transaction, logging not central to business logic without cluttering the code core to its functionality.

The good news is that something like that does exist: aspect-oriented programming (AOP). It separates general code from aspects that cross the boundaries of an object or a layer. For

example, the application log isn't tied to any application layer. It applies to the whole program and should be present everywhere.

Programming OOPs in
the sense that it also
provides modularity.

But the key unit of
modularity is aspect
than class. AOP
breaks the program
logic into distinct parts
(called concerns). It is
used to increase
modularity by cross-
cutting concerns. A
cross-cutting concern
is a concern that can

affect the whole application and should be centralized in one location in code as possible, such as transaction management, authentication, logging, security etc.
