Most patients with pancreatic ductal adenocarcinoma (PDAC) present with symptomatic, surgically unresectable disease. Although the goal of early detection of PDAC is laudable and likely to result in significant improvement in overall survival, the relatively low prevalence of PDAC renders general population screening infeasible.

For the early detection of CRC, methylation of the SEPT9 (mSEPT9) gene located on chromosome 17 at q25.3 3 has shown promise as a ctDNA biomarker as CRC tumours have an increased likelihood of exhibiting methylation of the promoter region of the SEPT9 gene. 3 For this test, a purified DNA sample obtained from peripheral blood is evaluated using duplex real-time PCR to identify methylation in the v2 region of the SEPT9 gene, 3 which is suggestive of CRC.

Utility of the methylated SEPT9 test for the early ...
