railway structures This chapter discusses durability problems of British concrete railway bridges, of which there are about 3,800. The problems arise mainly from steel reinforcement corrosion and concrete deterioration; several illustrative examples are considered of actual bridges where these problems have arisen, and some indications are given of the remedies applied.

durability was found to be corrosion of reinforcement due to chloride ingress, mainly in older structures with relatively low concrete cover to the reinforcement [Wiebenga 1980]. In view of the young age of the investigated structures relative to the slow rate of degradation, it was recommended to carry out a similar study in about 15 years time.
