Since students have just completed a factoring unit, they are good about identifying the greatest common factor of x . So, $x(x+4)(x+1)$ is just a generalization of the zero product property where $abc=0$. Slide 4 presents an equation that can be contrasted with Slide 3. I will help students factor this equation as $2(x+2)(x+1)=0$.

The complete factoring is: $\frac{1}{2}(4x-7)(x-1)$. If we were to solve this trinomial, we would get $\left\{x:\text{text}\{x\}=\frac{7}{4},\text{text}\{ }1\right\}$ by setting each factor to 0 and solving for x . (Ignore the factor of 2, since 2 can never be 0. If we had an x on the outside, an additional factor would be 0).
