DIFFERENTIAL CALCULUS As for a real-valued function, it is easily seen that a process is continuous at  $t$  if it is differentiable at  $t$ . Hence is continuous if it is differentiable, but it may also be continuous without being differentiable. In analogy to (08.34) and (08.35), we also use the notation  $p(k) := k^p$  for all  $k \in \mathbb{N}$  ...

review of differential calculus theory 3 We can thus define the gradient of  $f$  in  $x$  as  $\nabla_x f := u$ . Then, as a conclusion, we can rewrite equation 2.1 Gradients and differential of a function are conceptually very different. The gradient is a vector, while the differential is a function  $f(x+h) = f(x) + dx f'(x) + o(|h|)$  (2) =  $f(x) + h^T \nabla f(x) + o(|h|)$  (3) ...

Differential calculus, Branch of mathematical analysis, devised by Isaac Newton and G.W. Leibniz, and concerned with the problem of finding the rate of change of a function with respect to the variable on which it depends. Thus it involves calculating derivatives and using them to solve problems involving nonconstant rates of change.

In mathematics, differential calculus is a subfield of calculus that studies the rates at which quantities change. It is one of the two traditional divisions of calculus, the other being integral calculus—the study of the area beneath a curve. The primary objects of study in differential calculus are the derivative of a function, related notions such as the differential, and their applications. The derivative of a function at a chosen input value describes the rate of change of the ...
