...

Human Learning: Biology, Brain, and Neuroscience. Human learning is studied in a variety of ways. Motor learning is often studied separately from verbal learning. Studies may delve into anatomy vs function, may view behavioral outcomes or look discretely at the molecular and cellular level of learning.

Human brain structure and function. The nervous system processes information throughout the body by carrying signals between the central nervous system (CNS) and peripheral nervous system (PNS). The CNS is composed of the brain and spinal cord, while the PNS consists of nerves which are connected to the CNS and reach the rest of the body. The brain has several key parts: the medulla oblongata, the cerebellum, the cerebrum, the hypothalamus and the hippocampus.

Brain, the mass of nerve tissue in the anterior end of an organism. The brain integrates sensory information and directs motor responses; in higher vertebrates it is also the centre of learning. The human brain weighs approximately 1.4 kg (3 pounds) and is made up of billions of cells called neurons.

[brain | Definition, Parts, Functions, & Facts | Britannica](#)

The brain of a human being plays significant role, as it controls most of the activities of the human body. The brain is

located inside the head, and protected by the skull bones. The brain consists of more than 86 billion neurons and almost equal number of other cells as well. Brain activity is made possible because of the interconnections of all the neurons that are linked together. The study of brain functions is known as neuroscience.

Biology - Human Brain - Tutorialspoint

Learning changes the physical structure of the brain. These structural changes alter the functional organization of the brain; in other words, learning organizes and reorganizes the brain. Different parts of the brain may be ready to learn at different times.
