The proportional, integral and derivative (PID) controller is a control loop feedback mechanism to ensure that the system is operating as intended. The PID is used to calculate the deviation to determine a correction factor and pass onto the process systems. PID controllers are used to remove the need for constant adjustments by the operator.

- Phone chargers have voltage and current control.
- Streetlights have light control.

These are small examples of control, but control can be developed into much larger systems. Heavy industry use control to monitor the condition of their equipment, we need to consider the pressure and the condition of pipework.
