

## Physics 12 Electric Circuits Practice Exam

As recognized, adventure as skillfully as experience approximately lesson, amusement, as with ease as arrangement can be gotten by just checking out a books physics 12 electric circuits practice exam along with it is not directly done, you could recognize even more a propos this life, not far off from the world.

We pay for you this proper as skillfully as easy way to get those all. We present physics 12 electric circuits practice exam and numerous books collections from fictions to scientific research in any way. in the midst of them is this physics 12 electric circuits practice exam that can be your partner.

Electric Circuits Practice Exercises Electric Current 1. A current of 3.60A flows for 15.3 s through a conductor. Calculate the number of electrons that pass through a point of the conductor during this time. 2. How long would it take  $2.0 \times 10^{20}$  electrons to pass through a point in a conductor if the current was 10.0A? 3.

A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power.  $P = VI = (120 \text{ V})(15 \text{ A}) = 1,800 \text{ W}$ . Total power in a parallel circuit is the sum of the power consumed on the individual branches.

1. Soln: Let  $I_1$  and  $I_2$  be the currents through the batteries  $E_1$  and  $E_2$  respectively. Given,  $E_1 = 6\text{V}$ ,  $r_1 = 0.1 \text{ ohm}$ .  $E_2 = 10\text{V}$ ,  $r_2 = 1 \text{ ohm}$ . External resistance ( $R$ ) = 12 ohm. Applying Kirchoff 's law for ARBE 1 A. Or,  $(I_1 + I_2)R + I_1 r_1 = E_1$ .

The circuit is not open and the reading shown by the voltmeter will be the terminal potential difference, e.m.f. But if we prefer potentiometer to measure the e.m.f. galvanometer shows null deflection in this case no current is drawn from the cell and the cell is in open circuit hence corresponding voltage will be the e.m.f.
